

Problem

Return the quotient after dividing dividend by divisor.

If the result exceeds the 32-bit signed integer range, return:

2147483647 for overflow -2147483648 for underflow

Complete the function divide in the editor below.

Function Signature

int divide(int dividend, int divisor)

Parameters int dividend: The number to be divided. int divisor:

The number by which to divide. Returns int: The quotient obtained after division.

Input Format

A single line containing two space-separated integers:

dividend divisor

Constraints

$-2^{31} \leq \text{dividend} \leq 2^{31} - 1$ $-2^{31} \leq \text{divisor} \leq 2^{31} - 1$

divisor $\neq 0$

Output Format

Print a single integer representing the quotient.

[Change Theme](#)

Language Python 3

```
1 def divide(dividend, divisor):
2     INT_MAX = 2**31 - 1
3     INT_MIN = -2**31
4     quotient = int(dividend / divisor)
5     if quotient > INT_MAX:
6         return INT_MAX
7     if quotient < INT_MIN:
8         return INT_MIN
9     return quotient
10 dividend, divisor = map(int, input().split())
11 print(divide(dividend, divisor))
12
```
